

Subj: Paid: volunteer data analyst, short term

Hi _____

I am designing a study to characterize how lay people approach problem solving using their self-tracked data. The data in this case are sets of year-long time series data from indoor air quality measurements collected at various locations our participant's homes.

We are looking for a data analyst fluent in R, pandas, or similar, and available for interactive problem solving activities with our users. These activities would require creating on-the-spot data summaries, aggregations, and/or plots in response to our users' ideas or suggestions.

This is a paid position: \$25 per 90-minute interview for approx. 10 interviews, plus an initial 90-minute training session (same \$25 rate) to get acquainted with the project, team members, datasets, and address any questions.

Could you pass this along or recommend any students who could be a good match?

Thanks!
